Volunteer LPGN IBOs experiencing flu-like effects took IMMUNE+++ for seven days and were contacted by LPGN Research Scientist Dr. Edward Andujar before, during and at the conclusion of the seven days to track their progress.

Running a temperature, head and body aches, and fatigue are generally associated with an especially weak immune system. Twenty-seven percent of participants had a flu shot recently, but were still experiencing a weakened immune system before trying IMMUNE+++.

All participants experienced positive effects after taking IMMUNE+++ for seven days.

Eighty-seven percent of participants felt completely well, and were no longer suffering from any discomforts by the end of day seven. Participants ingested four IMMUNE+++ tablets per day—two in the morning and two in the evening as they were already experiencing the effects of a weakened immune system.

However, the recommended usage for IMMUNE+++ is 1 tablet twice a day to keep the immune system strong and stay healthy.

These statements have not been evaluated by the Food and Drug Administration. This product is not intended to diagnose, treat, cure or prevent any disease.

This survey was a volunteer survey of associates of the Company, with no placebo or double-blinding. These results appear to be within the range of typical results, as we understand them from voluntary reports of consumers.
